

REDESIGNED Bore-Gard Locking Strap

ANNOUNCING...The Bore-Gard Locking Strap has been redesigned to provide a "Lock in Place" design feature. This "Lock in Place" feature includes two new barbs located directly under the node of the strap that lock on to the aperture slot when installed. The strap is also designed to fit flush with the O.D. of the conduit, and contains a crush rib to provide a frictional fit.

The NEW "Lock in Place" feature prevents the strap from slipping or being pulled out during a bore by providing extra resistance against the rigid forces of Horizontal Directional Drilling. Since the strap now lies below the top lip of the duct entry hole, you can still remove the strap for changes or rework situations by simply using small pliers.
